15

## What is claimed is:

- 1. An LED device comprising:
- a substrate;
- a blue LED mounted on the substrate for emitting blue 5 light;
- a white light emitting LED device having a transparent resin covering the blue LED and including phosphor particles each of which has a wave length converting characteristic to convertblue light to yellow light if the particle contacts 10 with the blue light, thereby emitting white light due to the mixing of the blue light and the yellow light;
  - a red light emitting LED device having a substrate, a red LED mounted on the substrate for emitting red light, and a transparent resin covering the red LED; and
  - the red LED device being disposed so that emitted red light mixes with the white light emitted from the white light emitting LED device.
- The LED device according to claim 1 wherein the white light emitting LED device and the red light emitting 20 LED device are mounted on a same substrate.
  - 3. The LED device according to claim 2 wherein the blue light emitting LED and the red light emitting LED are covered by a single transparent resin including phosphor particles.
- 25 4. The LED device according to claim 1 wherein the phosphor particles are particles of YAG.
  - The LED device according to claim 1 wherein the phosphor particle is green phosphor.

- The LED device according to claim 1 wherein the phosphorparticle is one of phosphate, silicate and aluminate.
- 7. The LED device according to claim 1 wherein the LED device is mounted in a case.
- 5 8. The LED device according to claim 1 wherein the white light emitting LED device and the red light emitting LED device are disposed on an incident surface of an illuminating panel.
